BANOCIDE / BANOCIDE FORTE

1. Generic Name

Diethylcarbamazine Citrate Tablets IP

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

BANOCIDE TABLETS
Each uncoated tablet contains
Diethylcarbamazine Citrate I.P. 50 mg

BANOCIDE FORTE TABLETS
Each uncoated tablet contains
Diethylcarbamazine Citrate I.P. 100 mg

3. DOSAGE FORM AND STRENGTH

Tablet

4. CLINICAL PARTICULARS

4.1 Therapeutic Indication

For the treatment of:
• filarial infections due to Wuchereria bancrofti, Loa loa, Brugia malayi and Brugia timori
• tropical eosinophilia
• toxocariasis

For the prophylaxis against:
• loiasis

4.2 Posology and Method of Administration

Diethylcarbamazine should be administered after meals.

Route of Administration

For oral use.

Adults

Allergic manifestations induced by the action of diethylcarbamazine on the parasite are most commonly seen early in treatment. For this reason, the administration of diethylcarbamazine should commence with a low dose which is increased over the next 2 to 3 days and maintained for the remainder of the treatment period.

Treatment of lymphatic filariasis
The starting dose is 1 mg/kg on the first day. This dose is gradually increased over 2 to 3 days to 6 mg/kg daily, administered preferably in divided doses, for 12 to 14 days.

The treatment may be repeated, if necessary, after a minimum delay of 10 days.

*Treatment of tropical eosinophilia*

The recommended dosage is 6 mg/kg daily for 14-21 days, repeated as necessary if symptoms reoccur.

*Treatment of toxocariasis*

The starting dose is 1 mg/kg twice daily. This dosage is gradually increased to 6 mg/kg daily, administered in two divided doses, for 21 days.

*Treatment of Loiasis*

In the case of severe microfilaraemia, treatment should be initiated under close medical supervision (see section 4.6 Special Warnings and Precautions for Use).

Treatment should start with very small doses, increasing gradually over 3 days to 6–9 mg/kg daily, administered in three divided doses, for 21 days.

In order to mitigate or prevent the occurrence of side effects, diethylcarbamazine may be combined with corticosteroids.

*Prophylaxis against Loiasis*

The recommended dose is 300 mg once a week.

*Children*

In children, diethylcarbamazine should always be administered under close medical supervision and in divided daily doses.

Diethylcarbamazine citrate may be given orally to children for the treatment of lymphatic filariasis, loiasis and toxocariasis.

*Treatment of lymphatic filariasis*

For the treatment of lymphatic filariasis in children under 10 years of age should be given half the usual adult dose.

*Treatment of Loiasis*

For the treatment of loiiasis children may be given a dose of 6 - 9 mg/kg daily in 3 divided doses for 12 days. Treatment should start with very small doses, increasing gradually over 3 days.

*Treatment of toxocariasis*
For the treatment of toxocariasis children may be given the same dose as for adults.

**Elderly**

There is no information on the effect of diethylcarbamazine on elderly individuals.

The same pattern of adverse reactions associated with the use of diethylcarbamazine in the treatment of filarial infections should be expected. Therefore, older patients should be treated with careful attention to the normal precautions (see section 4.4 Special Warnings and Precautions for Use).

**Renal Impairment**

In patients with renal insufficiency urinary excretion of diethylcarbamazine is reduced and plasma half-life prolonged according to the degree of renal impairment. Therefore, doses need to be adjusted in these patients.

**Hepatic Impairment**

Dose reduction is not necessary.

**4.3 Contraindications**

This medicinal product is contraindicated in:

- hypersensitivity to diethylcarbamazine citrate or to any of the excipients,
- serious eye damage in the course of onchocerciasis.

**4.4 Special Warnings and Precautions for Use**

**Initial Treatment**

During the first few days of treatment of filarial infections with diethylcarbamazine, patients should be monitored carefully for adverse reactions (see Section 4.8 Undesirable Effects). The intensity and the severity of the adverse reactions that appear after administration of diethylcarbamazine citrate are associated with the level of microfilariae in the blood prior to treatment. In the event of Loa loa infestation, the level of microfilariae present in the blood is often high, which predisposes the treated patients to an increased risk of serious side effects (see Section 4.8 Undesirable Effects).

The dosage should be increased gradually in individuals showing no or mild reactions and should be slower in individuals showing more severe reactions. In the large majority of cases, reactions resolve during treatment.

**Serious central nervous system complications in patients with Loa loa infestation**

Serious central nervous system problems such as encephalopathy and coma have been reported, in particular in patients with Loa loa infestation that have been treated with diethylcarbamazine. Although rare, fatalities have been reported.
These reactions can be mitigated or prevented by the introduction of a progressive dosage and the addition of corticosteroids.

**Alkaline urine**

Dietas that promote the alkalisation of the urine may increase the elimination half-life of diethylcarbamazine. Dose reductions may be needed.

**Hypersensitivity Reactions**

In the event of a severe hypersensitivity reaction, administration of a corticosteroid, such as betamethasone, is recommended.

**Seizure threshold**

Diethylcarbamazine must be used with care in patients who have a history of convulsions or factors that predispose them to convulsions.

**Concomitant disorders**

In the event of an acute concomitant disorder, the patient should be allowed to recover before taking diethylcarbamazine.

**Excipients**

*BANOCIDE TABLETS and BANOCIDE FORTE TABLETS*

**Lactose**

This medicinal product contains lactose. Patients with rare hereditary problems of galactose intolerance, the Lapp lactase deficiency or glucose-galactose malabsorption should not take this medicine.

**4.5 Drug Interactions**

There are no relevant data available.

**4.6 Use in Special Populations (such as pregnant women, lactating women, paediatric patients, geriatric patients etc.)**

**Pregnancy and Lactation**

**Fertility**

There are no relevant data available.

**Pregnancy**

Diethylcarbamazine should not be used during pregnancy. In view of the severe reactions which may follow diethylcarbamazine administration, it is advisable to postpone treatment of pregnant women until after parturition.
**Lactation**

The use of diethylcarbamazine is not recommended during breast-feeding. No data are available on the excretion of diethylcarbamazine citrate or its metabolites in human breast milk.

**Children**

In children, diethylcarbamazine should always be administered under close medical supervision and in divided daily doses.

Diethylcarbamazine citrate may be given orally to children for the treatment of lymphatic filariasis, loiasis and toxocariasis.

*Treatment of lymphatic filariasis*

For the treatment of lymphatic filariasis in children under 10 years of age should be given half the usual adult dose.

*Treatment of Loiasis*

For the treatment of loiasis children may be given a dose of 6 - 9 mg/kg daily in 3 divided doses for 12 days. Treatment should start with very small doses, increasing gradually over 3 days.

*Treatment of toxocariasis*

For the treatment of toxocariasis children may be given the same dose as for adults.

**Elderly**

There is no information on the effect of diethylcarbamazine on elderly individuals.

The same pattern of adverse reactions associated with the use of diethylcarbamazine in the treatment of filarial infections should be expected. Therefore, older patients should be treated with careful attention to the normal precautions (see section 4.4 Special Warnings and Precautions for Use).

**Renal Impairment**

In patients with renal insufficiency urinary excretion of diethylcarbamazine is reduced and plasma half-life prolonged according to the degree of renal impairment. Therefore, doses need to be adjusted in these patients.

**Hepatic Impairment**

Dose reduction is not necessary

**4.7 Effects on Ability to Drive and Use Machines**
Patients should be informed of the risk of drowsiness associated with the use of diethylcarbamazine which may impact on the ability to drive and use machines (see Section 4.8 Undesirable Effects).

4.8 Undesirable Effects

Clinical Trial Data and Post Marketing Data

Adverse drug reactions (ADRs) are listed below by MedDRA system organ class and by frequency.

Frequencies are defined as:
Very common $\geq 1/10$
Common $\geq 1/100$ to $<1/10$
Uncommon $\geq 1/1000$ to $<1/100$
Rare $\geq 1/10000$ to $<1/1000$
Very rare $<1/10000$
Not known (cannot be estimated from the available data).

In the absence of a filarial infection the only side effects of diethylcarbamazine, when given at the recommended dosage, are nausea and vomiting.

Adverse reactions to treatment with diethylcarbamazine vary with the infecting filarial species. Treatment of bancroftian filariasis with diethylcarbamazine results in the development of fewer and milder reactions than those seen following therapy of infection with Brugia spp or Loa loa.

Reactions associated with the microfilaricidal action of diethylcarbamazine resolve during treatment.

Blood and lymphatic system disorders
Not known: lymphadenitis$^{1,2}$, lymphangitis$^{1,2}$, lymphoedema$^{1,2}$

Immune system disorders
Not known: reactions resembling the Mazzotti reaction, allergic reactions (see Skin and subcutaneous tissue disorders)

Metabolism and nutrition disorders
Not known: anorexia

Nervous system disorders
Not known: dizziness, headache, seizures (in patients with history of epilepsy), meningoencephalitis$^3$ (see Section 4.4 Special Warnings and Precautions for Use)

Vascular disorders
Not known: inflammation around the vessels$^{1,2}$

Respiratory, thoracic and mediastinal disorders
Not known: asthmatic attack
Gastrointestinal disorders
Not known: nausea, vomiting

Skin and subcutaneous tissue disorders
Not known: urticaria, pruritus$^3$, rash$^3$

Musculoskeletal and connective tissue disorders
Not known: myalgia$^4$, arthralgia$^1,3$

Renal and urinary disorders
Not known: haematuria, proteinuria

General disorders and administration site conditions
Not known: fever, rigors, malaise, chills$^{1,2}$, localised oedema$^{1,2}$, oedema$^3$, nodules$^{1,2}$ (palpable subcutaneously and along spermatic cord, formed by recently killed worms)$^1$ – in patients with Brugia malayi or Brugia timori infection
$^2$ – in patients with Wuchereria bancrofti infection
$^3$ – in patients with Loa loa infection

4.9 Overdose

Symptoms and signs
Symptoms are likely to consist of nausea, vomiting, headache, dizziness, drowsiness and, in serious cases, convulsions.

Treatment
Adequate fluids should be given to ensure optimal diuresis. Acidification of urine should enhance the excretion of diethylcarbamazine. Routine supportive measures should be given when necessary.

Further management should be as clinically indicated or as recommended by the national poisons centre, where available.

5. PHARMACOLOGICAL PROPERTIES

5.1 Mechanism of Action
The mode of action is uncertain. At least 2 types of effects of diethylcarbamazine on microfilariae have been reported. The drug has been shown to induce immobilization of the worm by decreasing muscle activity; this may be related to hyperpolarization effects caused by the piperazine moiety. Alteration of the surface membrane of microfilariae also appears to occur, facilitating enhanced destruction by the host's immune system. Recent evidence suggests that diethylcarbamazine may enhance adhesion of granulocytes to microfilariae via antibody-dependent and independent mechanisms. Platelets may also play a role in mediating effects against microfilariae. Interference of microfilarial intracellular processing and transport of specific macromolecules by diethylcarbamazine, or other effects of the drug on immune and/or inflammatory responses of the host have also been suggested to explain filaricidal actions.
Diethylcarbamazine is microfilaricidal for all species for which it is indicated. In addition, diethylcarbamazine leads to almost complete destruction of adult Loa loa; however it has variable macrofilaricidal activity against other filarial species.

5.2 Pharmacodynamic Properties

Pharmacotherapeutic group: Antinematodal agents; ATC Code: P02CB02.

5.3 Pharmacokinetic Properties

Absorption

Diethylcarbamazine is rapidly absorbed from the gastrointestinal tract. After a single dose, peak plasma levels are reached within 1 to 2 hours. The plasma half life is approximately 9 hours. Increasing doses, given over several days, result in a proportional rise in plasma levels. When a daily maintenance dosage of 900 mg is given, the mean plasma level remains constant, showing no accumulation on prolonged dosing.

Distribution

Diethylcarbamazine is widely distributed in tissues. In animals, diethylcarbamazine distributes in similar amounts to most tissues, except adipose tissue. High drug concentrations have been found in the pituitary gland, lymph nodes, adrenal medulla, and salivary glands. Diethylcarbamazine crosses the blood-brain barrier.

Metabolism

Diethylcarbamazine is eliminated largely as unchanged drug, with relatively small amounts being excreted as the N-oxide metabolite.

Elimination

Diethylcarbamazine and its metabolites are excreted in the urine. Urinary excretion and hence plasma half-life is dependent on urinary pH. About 5% of a dose is eliminated in the faeces.

Special patient populations

Renal Impairment

The plasma half life of diethylcarbamazine is increased in patients with renal insufficiency, whereas acidification of urine significantly increases the excretion rate of diethylcarbamazine, thereby markedly reducing the plasma half life.

Vegetarians

In certain regions, the diet is predominantly vegetarian, which promotes alkaline urine (pH 7.5 to 8). When an alkaline urinary pH is maintained, the elimination half-life of diethylcarbamazine is increased, whereas acidification of urine significantly increases the excretion rate of diethylcarbamazine.

5.4 Clinical Studies
There are no relevant data available.

6. NONCLINICAL PROPERTIES

6.1 Animal Toxicology or Pharmacology

Carcinogenesis, mutagenesis
There are no data as to whether diethylcarbamazine has mutagenic or carcinogenic potential.

Teratogenicity
Diethylcarbamazine is not teratogenic at high doses in rats and rabbits.

7. DESCRIPTION

Tablet
*BANOCIDE TABLETS*
Each uncoated tablet contains
Diethylcarbamazine Citrate I.P. 50 mg

*BANOCIDE FORTE TABLETS*
Each uncoated tablet contains
Diethylcarbamazine Citrate I.P. 100 mg

List of Excipients

*BANOCIDE TABLET*
Lactose, Maize starch, Calcium Silicate, Magnesium Stearate.

*BANOCIDE FORTE TABLET*
Lactose, Maize Starch, Calcium Silicate, Magnesium Stearate, Sodium Starch Glycolate.

8. PHARMACEUTICAL PARTICULARS

8.1 Incompatibilities
There are no relevant data available.

8.2 Shelf Life
The expiry date is indicated on the label and packaging.

8.3 Packaging Information
*BANOCIDE TABLETS & BANOCIDE FORTE TABLETS*
Strips of tablets in a carton.

8.4 Storage and Handling Instructions
BANOCIDE TABLETS and BANOCIDE FORTE TABLETS

Store at temperature not exceeding 30° C, protected from moisture.

Keep out of reach of children.

For oral use only.

There are no special requirements for use or handling of this product.

9. PATIENT COUNSELLING INFORMATION

Registered Medical Practitioners may counsel their patients (and/or patient’s caregiver as applicable) about the special warnings and precautions for use, drug interactions, undesirable effects, and any relevant contra-indications of BANOCIDE TABLETS & BANOCIDE FORTE TABLETS. Patients (and/or patient’s caregiver) may also be informed about posology, method of administration and storage/handling information as applicable.

10. DETAILS OF MANUFACTURER

For further information please contact:
GlaxoSmithKline Pharmaceuticals Limited.
Registered Office
Dr. Annie Besant Road, Worli
Mumbai 400 030, India.

11. DETAILS OF PERMISSION OR LICENCE NUMBER WITH DATE

Import Licence / Manufacturing Licence number is indicated on the label and packaging.

12. DATE OF REVISION

23-Jun-2021

Trade marks are owned by or licensed to the GSK group of companies.

Version No: BAN/PI/IN/2021/01

Adapted from Diethylcarbamazine citrate NCDS v04 dated 16 March 2021.
